REACTIVATION OF THE ALPHA SUBUNIT OF THE E1 COMPONENT OF THE
PYRUVATE DEHYDROGENASE COMPLEX (BY SIMILARITY).
CATALYTIC ACTIVITY: [Pyruvate dehydrogenase (lipoamide)] phosphate
+ H(2)O = [Pyruvate dehydrogenase (lipoamide)] + phosphate
- COFACTOR: MAGNESIUM DEPENDENT (BY SIMILARITY).
SUBUNIT: HETERODIMER OF A CATALYTIC SUBUNIT AND A FAD PROTEIN OF
UNKNOWN FUNCTION (BY SIMILARITY).
SUBCELLULAR LOCATION: Mitochondrial matrix (By similarity).
SIMILARITY: BELONGS TO THE PP2C FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                HUMAN

"Identification of a new family of human epithelial protein kinases containing two leucine/isoleucine-zipper domains.";
Eur. J. Biochem. 213:701-710(1993).
-i- CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.
-i- TISSUE SPECIFICITY: EXPRESSED IN BRAIN AND SKELETAL MUSCLE.
-i- SIMILARITY: BELONGS TO THE SER/THR FAMILY OF PROTEIN KINASES.
MAP KINASE KINASE KINASE SUBFAMILY.
-i- SIMILARITY: CONTAINS 1 SH3 DOMAIN.

Dorow D.S., Devereux L., Dietzsch E., de Kretser T.;

Identification of a new family of human epithelial protein kinases containing two leucine/isoleucine-zipper domains.";

Eur. J. Biochem. 213:701-710(1993).

-! TISSUE SPECIFICITY: EXPRESED IN RPITHELIAL TUMOR CELL LINES OF COLONIC, BREAST AND OESOPHAGEAL ORIGIN.

-! SIMILARITY: BELONGS TO THE SER/THR FAMILY OF PROTEIN KINASES.

MAP KINASE KINASE KINASE SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Euteleostomi;

                                                                                                                                                                                                                                                 -!- COFACTOR: Magnesium.
-!- SUBCELIULAR LOCATION: Cytoplasmic and membrane-associated.
-!- TISSUE SPECIFICITY: Expressed in brain, kidney, lung, heart, testis, gastrointestial tract, stomach, liver and pancreas. Within the nervous system, predominantly expressed in neurons and enriched in synaptic terminals.
                                                                                                                                                                                                       'n.
                                                                            MEDLINE-96279269; PubMed=8663324;
Mata M., Merritt S.E., Fan G., Yu G.G., Holzman L.B.;
"Characterization of dual leucine zipper-bearing kinase, a mixed lineage kinase present in synaptic terminals whose phosphorylation state is regulated by membrane depolarization via calcineurin.";
J. Biol. Chem. 271:16888-16896(1996).
--- FUNCTION: May be an activator of the JNK/SAPK pathway.
Phosphorylates beta-casein, histone 1 and myelin basic protein:
